

# SOCKET HEAD CAP SCREWS

Why Socket Screws? . . . Why UNBRAKO ■ "Profile" of Extra Strength

## PROFILE OF EXTRA STRENGTH

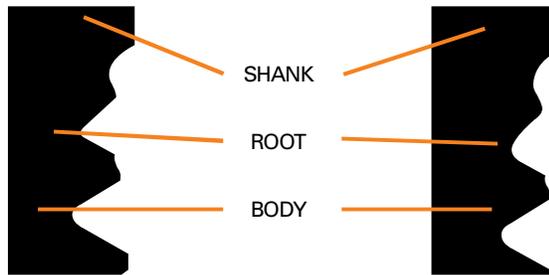

Deep, accurate socket for high torque wrenching. Knurls for easier handling. Marked for easier identification.

Head with increased bearing area for greater loading carrying capacity. Precision forged for symmetrical grain flow, maximum strength.

Elliptical fillet doubles fatigue life at critical head-shank juncture.

"3-R" (radiused-root runout) increases fatigue life in this critical head-shank juncture.

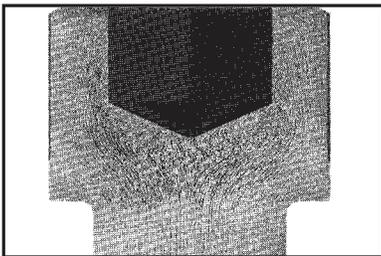

**CONVENTIONAL THREAD RUNOUT** – Note sharp angle at root where high stress concentration soon develops crack which penetrates into body of the screw.

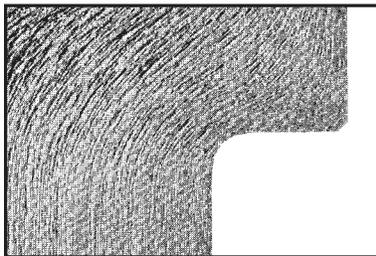

**UNBRAKO "3-R" (RADIUSED ROOT RUNOUT) THREAD** – Controlled radius of runout root provides a smooth form that distributes stress and increases fatigue life of thread run-out as a much as 300% in certain sizes.

Fully formed radiused thread increases fatigue life 100% over flat root thread forms.

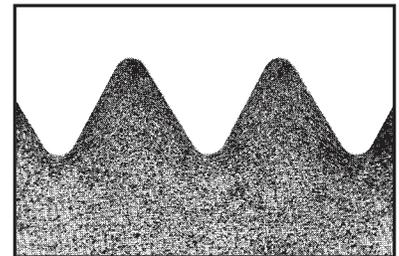

Controlled heat treatment produces maximum strength without brittleness.

Accurate control of socket depth gives more wrench engagement than other screws, permits full tightening without cracking or reaming the socket, yet provides ample metal in the crucial fillet area for maximum head strength.

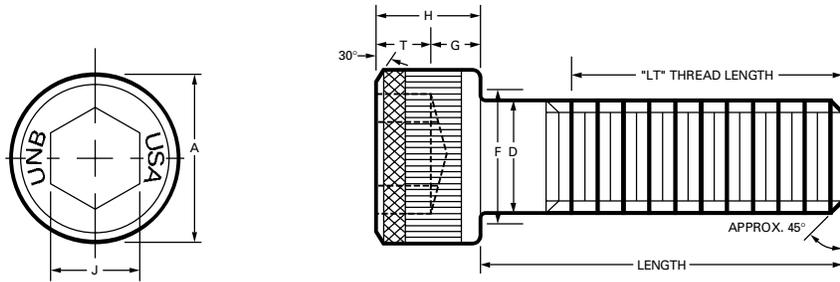

Controlled head forging, uniform grain flow, unbroken flow lines; makes heads stronger; minimizes failure in vital fillet area; adds to fatigue strength.

Contour-following flow lines provide extra shear strength in threads, resist stripping and provide high fatigue resistance. The large root radius UNBRAKO socket screw development doubles fatigue life compared to flat root thread forms.

## SOCKET HEAD CAP SCREWS ■ 1960 Series ■ Dimensions ■ Mechanical Properties

Head markings may vary slightly depending on manufacturing practice. Diamond knurls, UNBRAKO, and UNB are recognized identifications for 1/4" diameter and larger.

1960 Series ■ Dimensions ■ Mechanical Properties ■ Application Data

## NOTES

**Material:** ASTM A574 – alloy steel  
ASTM F837 – stainless steel

**Dimensions:** ANSI/ASME B18.3

**Hardness:** Alloy Steel – Rc 38-43  
Stainless Steel – Rb 80 – Rc 33

**Concentricity:** Body to head O.D. – within 2% of body diameter T.I.R. or .006 T.I.R. whichever is greater. Body to hex socket – (sizes through 1/2") – within 3% of body diameter T.I.R. or .005 T.I.R. whichever is greater; (sizes over 1/2" – within 6% of body diameter).

The plane of the bearing surface shall be perpendicular to the axis of the screw within a maximum deviation of 1°.

For body and grip lengths see pages 8 and 9.

**Thread Class:** #0 through 1" dia. – 3A; over 1" dia. – 2A.

## Typical values for test specimens:

Alloy Steel      Stainless Steel

**Elongation in 2 inches:**      10% min.    10% min.

**Reduction of area:**            35% min.    30% min.

\*Seating torques for alloy steel calculated in accordance with VDI 2230, "Systematic Calculation of High Duty Bolted Joints," to induce approximately 120,000 PSI in the screw threads through 0.500-inch diameter, and 115,000 PSI over 0.500-inch diameter. Seating torques for stainless steel are calculated to induce approximately 40,000 PSI stress. Values are for plain screws. For cadmium plated screws, multiply recommended seating torque by .75; for zinc plated screws multiply by 1.40. See note, page 1.

See Technical Guidelines section for additional information on torques, installation, and hole preparation.

# SOCKET HEAD CAP SCREWS

## 1960 Series ■ Body and Grip Lengths

L<sub>G</sub> is the maximum grip length and is the distance from the bearing surface to the first complete thread.

L<sub>B</sub> is the minimum body length and is the length of the unthreaded cylindrical portion of the shank.

Thread length for the sizes up to and including 1" diameter shall be controlled by the grip length and body length as shown in the table.

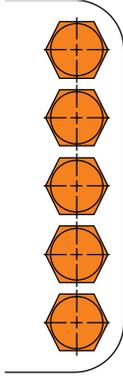

For sizes larger than 1" the minimum complete thread length shall be equal to the basic thread length, and the

total thread length including imperfect threads shall be basic thread length plus five pitches. Lengths too short to apply formula shall be threaded to head. Complete threads shall extend within two pitches of the head lengths above the heavy line on sizes up to and including 5/8" diameter. Larger diameters shall be threaded as close to the head as practicable.

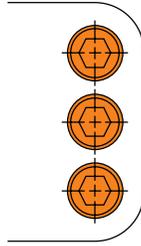

Screws of longer lengths than those tabulated shall have a thread length conforming to the formula for sizes larger than 1".

## FEWER HOLES TO DRILL AND TAP

three screws do the work of five

### old method

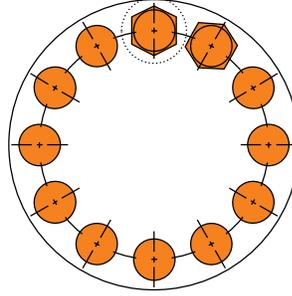

5-3/8-16 screws @  
120,000 psi tensile  
85,000 psi yield =  
 $5 \times 85,000 \times .0775 =$   
33,000 lbs. max. load

### UNBRAKO method

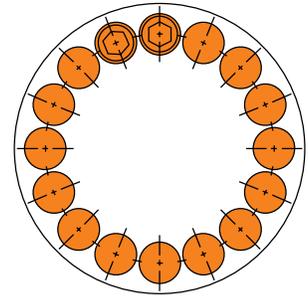

3-3/8-16 screws @  
190,000 psi tensile  
170,000 psi yield =  
 $3 \times 170,000 \times .0775 =$   
39,000 lbs. max. load

## COMPACT SPACING

clearance for socket wrench

no wrench clearance necessary

### old method

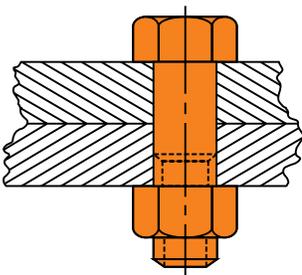

12-3/4-16 hexagon  
head screws @  
120,000 psi tensile  
strength  
Total strength =  
537,000 lbs.

### UNBRAKO method

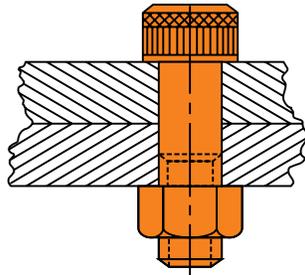

16-3/4-16 socket head  
cap  
screws @ 180,000 psi  
tensile strength  
Total strength =  
1,074,200 lbs.

## HIGH TENSILE AND YIELD STRENGTH

ordinary bolts

socket head cap screws

### old method

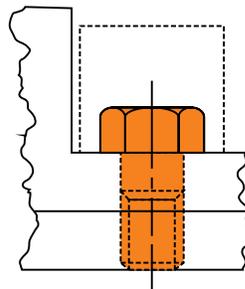

120,000 psi. 1/2-20 bolt  
tensile = 19,200 lbs.  
yield = 13,600 lbs.

### UNBRAKO method

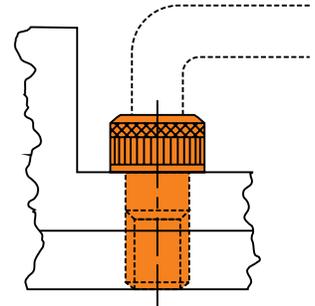

190,000 psi 1/2-20  
UNBRAKO  
tensile = 30,400 lbs.  
yield = 27,200 lbs.  
**Extra UNBRAKO joint  
strength:**  
tensile – 58% increase  
yield – 100% increase

## HIGH SHEAR STRENGTH

ordinary bolts

socket head cap screws

### old method

120,000 psi. 1/2-20 bolt  
Shear strength =  
14,100 lbs.

### UNBRAKO method

190,000 psi. 1/2-20  
UNBRAKO  
Shear strength =  
22,400 lbs.  
**Extra UNBRAKO shear  
strength = 8,300 lbs.  
less wrenching space  
needed**
